

Calibrated leak masters from Uson let you verify the performance of your leak tester or flow meter and are an essential accessory for your leak detection equipment and metrology department.

Calibrated leak masters from Uson let you verify the performance of your leak tester or flow meter and are an essential accessory for your leak detection equipment and metrology department.

Certified performance

Available in a wide range of leak and flow rates at various pressures up to 1000psig, Uson leak masters are certified using NIST traceable devices.

The Uson leak master uses a precision made laser drilled orifice sealed in place between SAE O-rings. The hole is protected by an anodized aluminum body.

Top-quality calibration

Unlike other leak masters, Uson's leak masters may be disassembled for cleaning so solvents and oil will not cause permanent damage. The leak rate can be changed if necessary by replacing the laser drilled orifice itself.

Choose from standard brass quick-connect or stainless steel fittings, in standard or small size. Other fittings can be accommodated if required — please ask.

Supplied in a special case and labeled, a Uson leak master is a rugged and top-quality calibration device designed for use in industrial environments.

Accessories and repair services

In addition to leak masters, Uson offers quick connectors (Prex Seals), printers, cables and other accessories as well as full calibration and repair services.

Trusted resource

As a pioneer of automated leak detection equipment for medical devices, the automotive, pharmaceutical and medical packaging industries, and others, Uson has more experience in these specialized fields than any other company in the world.
